**Control Of Reproduction In The**  
Consequently, the control of  
reproduction in females is more complex

than that of the male. Aside from the hormone GnRH, FSH and LH, estrogens and progesterone are released from the developing follicles, which are structures on the ovaries that contain the maturing eggs. FSH stimulates the development of egg cells, called ova.

The vagina carries the female's

menstrual flow outside the body, receives the male penis during intercourse, and serves as the birth canal during labor. In the reproductive process, a male sperm and a female egg provide the information required to produce another human being. Conception occurs when these cells join as the egg is fertilized.
