Through comparative studies I have tried to synthesize the fundamental principles of high altitude entomology. I have described here the distinctive characters of the high altitude environment, the ecological specializations of the high altitude insects, their ecological inter relations and the outstanding peculiarities of their biogeography.

Biogeography is of great interest in light of current environmental changes and ever-increasing anthropogenic pressure. It allows us to identify areas of high biodiversity (biodiversity hotspots), to establish ecological monitoring and to propose scenarios about the future of biodiversity.

Biogeography and ecology continue to explore the world from different perspectives, reflecting each discipline's history, particularly the distinction between observational and experimental approaches, and the different scales of relevant patterns and processes (table 1). In general, biogeography addresses evolutionary, climatic and geological processes (e.g. plate tectonics) to explain the distribution of diversity over the surface of the Earth and across its oceans.

Countries showing relatively high amounts of mangrove loss include Myanmar, Malaysia, Cambodia, Indonesia and Guatemala. Indonesia remains by far the largest mangrove-holding nation, containing between 26% and 29% of the global mangrove inventory with a deforestation rate of between 0.26% and 0.66% per year.

Global Ecology and Biogeography focuses on the emerging field of macroecology: the study of broad, consistent patterns in the ecological characteristics of organisms and ecosystems. The journal emphasizes studies that address general ecological hypotheses, explored and tested using data of broad geographic, taxonomic, or temporal scope.

As such, biogeography also includes the study of the world's biomes and taxonomy—the naming of species—and has strong ties to biology, ecology, evolution studies, climatology, and soil science as they relate to animal populations and the factors that allow them to flourish in particular regions of the globe.

Why are polar bears found only in the Arctic? Why does mildew grow in your shower and not (hopefully) in your sock drawer? Learn how ecologists study the interactions between organisms and their environment, and how these interactions affect where, and in what numbers, different types of organisms are found.
